

Package ‘raerdata’

September 4, 2025

Title A collection of datasets for use with raer package

Version 1.7.0

Description raerdata is an ExperimentHub package that provides a collection of files useful for demonstrating functionality in the raer package. Datasets include 10x genomics scRNA-seq, bulk RNA-seq, and paired whole-genome and RNA-seq data. Additionally databases of human and mouse RNA editing sites are provided.

License MIT + file LICENSE

Imports ExperimentHub, Rsamtools, BiocGenerics, rtracklayer, SingleCellExperiment

Suggests rmarkdown, knitr, BiocStyle, testthat (>= 3.0.0)

VignetteBuilder knitr

Roxygen list(markdown = TRUE)

RoxygenNote 7.2.3

Encoding UTF-8

biocViews SingleCellData, SequencingData, RNASeqData, ExperimentHub, PackageTypeData, ExpressionData

GSE99249	<i>RNA sequencing data from study GSE99249</i>
----------	--

Description

Study **GSE99249** examined RNA editing in WT, ADAR1KO, and ADAR1-p150 HEK293T cells treated with and without interferon beta.

Usage

GSE99249()

Details

GSE99249() will download BAM and BAM index files from 6 RNA-seq libraries. 3 libraries are ADAR1 knockout cells treated with interferon beta and 3 libraries are wild type cells treated with interferon beta. The BAM files contain alignments from chromosome 18.

Value

- A list containing:
- bams A [BamFileList](#) object, indicating the BAM file paths and BAI indexes.
 - fasta A path to a fasta file from chr18 of hg38
 - snps a GRanges object containing known SNPs from the REDportal database (hg38)

Examples

GSE99249()

NA12878

*Whole genome and RNA sequencing data from NA12878 cell line***Description**

Whole genome and RNA sequencing data from NA12878 cell line

Usage

```
NA12878()
```

Details

Will download BAM and BAM index files from whole genome and RNA sequencing of the NA12878 cell line. The data is from the first megabase of chromosome 4. Additionally a fasta file and a database of known SNPs will be downloaded.

Value

A list containing:

- bams A [BamFileList](#) object, indicating the BAM file paths and BAI indexes.
- fasta A path to a fasta file containing the genome sequence of the first megabase of chr4 (hg38)
- snps a GRanges object containing SNPs from the first megabase of chr4

Examples

```
NA12878()
```

pbmc_10x

*single cell RNA sequencing data from human PBMCs***Description**

A 10x Genomics 3' single cell RNA-seq library from 10k PBMCs. The BAM file contains alignments from chr16. A [SingleCellExperiment](#) is also provided with pre-processed gene expression data, a UMAP projection and cell type annotations.

Usage

```
pbmc_10x()
```

Details

pbmc_10x() will download a BAM, BAM index file, REDportal RNA editing sites, and a SingleCellExperiment object from the [ExperimentHub](#).

Value

A list containing:

- bam a [BamFile](#) object indicating the BAM and BAI file paths. Contains alignments from only chr16 (hg38).
- sites a GRanges object containing known RNA editing sites from the REDportal database (hg38).
- sce a [SingleCellExperiment](#) object containing gene expression data, a UMAP projection and cell type annotations.

Examples

```
pbmc_10x()
```

raerdata	<i>raerdata</i>
----------	-----------------

Description

A collection of datasets and databases to demonstrate RNA-editing analysis approaches using the raer package.

Details

[atlases](#) a collection of RNA editing databases

[NA12878](#) Whole genome and RNA sequencing data from the NA12878 cell line

[GSE99249](#) RNA sequencing data from a study that examined RNA editing in WT, ADAR1KO, and ADAR1-p150 HEK293T cells treated with and without interferon beta.

[pbmc_10x](#) single cell RNA sequencing data from human PBMCs from 10x Genomics

rediportal_full_mm10	<i>Databases of known RNA editing sites</i>
----------------------	---

Description

Databases of known RNA editing sites

Usage

```
rediportal_full_mm10()
```

```
rediportal_coords_mm10()
```

```
rediportal_full_hg38()
```

```
rediportal_coords_hg38()
```

```
gabay_sites_mm10()
```

```
gabay_sites_hg38()
```

Details

`rediportal_full_hg38()` will download the human REDiportal database for hg38 which has been converted into a GRanges object. The GRanges is supplemented with additional columns of information provided by the REDiportal database, including gene location, repeat type, dbSNP annotation, and potential for amino-acid recoding.

`rediportal_coords_hg38()` will download the human REDiportal database for hg38 which has been converted into a GRanges object, which only contains the coordinates of the editing site.

`rediportal_full_mm10()` will download the mouse REDiportal database for mm10 which has been converted into a GRanges object. The GRanges is supplemented with additional columns of information provided by the REDiportal database, including gene location, repeat type, dbSNP annotation, and potential for amino-acid recoding.

`rediportal_coords_mm10()` will download the mouse REDiportal database for mm10 which has been converted into a GRanges object, which only contains the coordinates of the editing site.

`gabay_sites_hg38()` will download high-confidence human CDS editing sites (hg38).

`gabay_sites_mm10()` will download high-confidence mouse CDS editing sites (lifted-over from hg38 to mm10).

Value

A GRanges object.

Examples

```
gabay_sites_hg38()
```
