

# 3: Data-Based Generalization

John H Maindonald

August 19, 2014

## Ideas and issues illustrated by the graphs in this vignette

A central concern of data analysis is to generalize from results from the one data set that is available for analysis to some wider relevance. Ideas of sample and population are crucial for such generalization. A further important notion is that of a *sampling distribution*,

Mechanisms for assessing predictive accuracy include the use of theory, simulation (which extends the use of theory into areas where the calculations may be intractable), the training/test approach, cross-validation, and bootstrap methods.

**Note:** Figures 3.15 and 3.16 show results from repeated sampling – simulation or bootstrap sampling. The versions of these figures that are shown in Section 2 are for a substantially reduced number of repeat samples, relative to the text *Statistically Informed Data Mining*.<sup>1</sup>

## 1 Code for Functions that Give the Figures

```
fig3.1 <-
function (x=fCatWts){
lattice::stripplot(jitter(x), pch='|', xlab="Weight (kg)",
                   aspect=0.25, col="black", border="gray")
}
```

```
fig3.2 <-
function(x=fCatWts){
opar <- par(mfrow=c(2,2), xpd=TRUE,
           mar=c(3.6,3.1,3.6,1.1), mgp=c(2.25, 0.5, 0))
hist(x, labels=TRUE, xlim=c(2, 3),
     xlab="Height (cm)", main="", xpd=TRUE)
```

---

<sup>1</sup>Display of the figures can be suppressed, when processing this vignette through *knitr*, by placing an object `doFigs=FALSE` in the workspace.

```
