Package 'Trendy'

November 1, 2025

Type Package
Title Breakpoint analysis of time-course expression data
Version 1.32.0
Author Rhonda Bacher and Ning Leng
Maintainer Rhonda Bacher <rbacher@ufl.edu></rbacher@ufl.edu>
Description Trendy implements segmented (or breakpoint) regression models to estimate breakpoints which represent changes in expression for each feature/gene in high throughput data with ordered conditions.
Depends R (>= 3.4)
Imports stats, utils, graphics, grDevices, segmented, gplots, parallel, magrittr, BiocParallel, DT, S4Vectors, SummarizedExperiment, methods, shiny, shinyFiles
License GPL-3
Encoding UTF-8
LazyData true
RoxygenNote 6.1.1
Suggests BiocStyle, knitr, rmarkdown, devtools
VignetteBuilder knitr
biocViews TimeCourse, RNASeq, Regression, ImmunoOncology

breakpointDist

Distribution of breakpoints

Description

calculates number of breakpoints at each time.

Usage

Index

```
breakpointDist(topTrendyData, NDigits = 0)
```

Arguments

```
topTrendyData results from topTrendy() function

NDigits how many digits to be used when rounding (default is 0 (return integers))
```

Value

The function takes significant genes called from the topTrendyData() function. For any time point, this function calculates how many genes have a breakpoint at this time point. The output is the numbers of genes sorted by time point.

Author(s)

Ning Leng

Examples

```
m1 \leftarrow matrix(c(c(rnorm(50,5,1),sort(rnorm(50,15,5))), rnorm(100,50,10)), 2, 100, TRUE) rownames(m1) \leftarrow c("g1","g2") colnames(m1) \leftarrow paste0("time", seq_len(100)) myTrends \leftarrow results(trendy(<math>m1)) topGenes \leftarrow topTrendy(myTrends) bpDist \leftarrow breakpointDist(topGenes)
```

breakpointFit 3

Description

break point fits

Usage

```
breakpointFit(J, tVectIn, lmLinear, numTry)
```

Arguments

J	number of breakpoints in the model
tVectIn	a numerical vector indicating the time-points or the order of samples. If it is NULL (default), then the time/order will be assumed to be equaly spaced from 1:N (N is number of samples).
lmLinear	the linear model fit; no breakpoints
numTry	the number of different seeds to try. If all numTry runs fail, then the linear regression (no breakpoints, one segment) model will be returned.

extractPattern	Extract pattern from segmented regression

Description

find dynamic genes that follow a given pattern

Usage

```
extractPattern(trendyOutData, Pattern = NULL, adjR2Cut = 0.5,
   Delay = 0)
```

Arguments

trendyOutData	output from trendy() function
Pattern	vector containing pattern to search genes/features (e.g, c("up", "down")), nochange is designated by "same". If length is one (e.g c("up")) then it will only consider features with constant pattern across the entire time-course.
adjR2Cut	only consider features with adjusted $R^2 > adjR2Cut$. Default = .5.
Delay	search for pattern starting after certain time-point (e.g. only genes with a breakpoint > 10).

Value

Genes: names of genes/features containing pattern and the breakpoints corresponding to the pattern.

4 fitSegBIC

Author(s)

Rhonda Bacher

Examples

```
myTrends <- trendy(trendyExampleData[seq_len(5),], tVect=seq_len(40))
myTrends <- results(myTrends)
#extractPattern(myTrends, Pattern = c("up")) #increasing only features
#extractPattern(myTrends, Pattern = c("same", "down"))
#extractPattern(myTrends, Pattern = c("up", "down"), Delay = 20)</pre>
```

fitSegBIC

Fit segmented regression models on a feature/gene

Description

fits segmented regression models

Usage

```
fitSegBIC(Data, maxK = 2, tVectIn = NULL, minNumInSeg = 5,
    pvalCut = 0.1, numTry = 5, keepFit = FALSE)
```

Arguments

Data	a matrix of normalized expression measurements. Rows are genes/features and columns are samples.
maxK	maximum number of breakpoints to consider. For each gene, trendy will fit $\max K + 1$ models containing $0 \rightarrow \max K$ breakpoints $(1 \rightarrow \max K + 1)$ segments). The model with the lowest BIC value will be selected (unless forceRsq = TRUE, see below).
tVectIn	a numerical vector indicating the time-points or the order of samples. If it is NULL (default), then the time/order will be assumed to be equaly spaced from 1:N (N is number of samples).
minNumInSeg	minimum number of samples required to be within a segment. If a breakpoint model has a segment with fewer than minNumInSeg point in any segment, then the model is not considered valid.
pvalCut	p-value cutoff. If the p-value of a segment is greater than PvalCut, then the segment will be called as 'no change'.
numTry	the number of different seeds to try. If all numTry runs fail, then the linear regression (no breakpoints, one segment) model will be returned.
keepFit	whether to report the fitted object (default is FALSE).

Value

Trend: direction of each sample; -1: down, 0: no change, 1: up Slope: fitted slopes, Slope.Trend: sign of fitted slopes, Slope.Pvalue: p value of each segment, Breakpoint: estimated breakpoints, Fitted.Values: fitted values AdjustedR2: adjusted r value of the model Fit: fit object

Author(s)

Rhonda Bacher and Ning Leng

formatFunc 5

formatFunc

internal helper function to format results

Description

helper function to format result

Usage

formatFunc(IN)

Arguments

ΙN

the object to be formatted

Value

a formated matrix of results

Author(s)

Rhonda Bacher

formatResults

Function to format results for saving.

Description

format data from Trendy which can be saved for later use.

Usage

```
formatResults(topTrendyData, featureNames = NULL)
```

Arguments

topTrendyData results from topTrendy() function

featureNames an optional vector of features (if only interested in outputting a subset of fea-

tures/genes).

Value

The function will reformat the output from Trendy so that it can be easily save as a .txt or .csv file. If featureNames is supplied then only the information for those features/genes is returned.

Author(s)

Rhonda Bacher

6 plotFeature

Examples

```
data(trendyExampleData)
myTrends <- trendy(Data=trendyExampleData[seq_len(2),])
myTrends <- results(myTrends)
topTrendyRes <- topTrendy(myTrends)
resToSave <- formatResults(topTrendyRes)</pre>
```

getCounts

getCounts

Description

Convenient helper function to extract the normalized expression matrix from the SummarizedExperiment

Usage

```
getCounts(DATA)
```

Arguments

DATA

An object of class SummarizedExperiment that contains expression data and metadata

Value

A matrix which contains the expression data where genes/features are in rows and samples are in columns

Examples

```
m1 <- matrix(c(c(rnorm(50,5,1),sort(rnorm(50, 15, 5))), rnorm(100, 50,10)), 2, 100, TRUE)
ExampleData <-
SummarizedExperiment::SummarizedExperiment(assays=list("Counts"=m1))
myData <- getCounts(ExampleData)</pre>
```

plotFeature

Plot features of interest

Description

plot each feature with (or without) the fitted trend.

Usage

```
plotFeature(Data, tVectIn = NULL, featureNames, showFit = TRUE,
    simple = FALSE, showLegend = TRUE, trendyOutData = NULL,
    cexLegend = 1, legendLocation = "side", xlab = "Time",
    ylab = "Normalized Expression", segColors = c("chartreuse3",
    "coral1", "black", "cornflowerblue"), customTitle = NULL,
    customLabels.x = NULL, spacing.x = NULL)
```

plotFeature 7

Arguments

Data a matrix of normalized expression measurements. Rows are genes/features and

columns are samples.

tVectIn a numerical vector indicating the time-points or the order of samples. If it is

NULL (default), then the time/order will be assumed to be equaly spaced from

1:N (N is number of samples).

featureNames a list of genes or features to plot

showFit whether to plot the segmented regression fitting (default is TRUE)

simple if TRUE the plot will not highlight the breakpoints and segments and will only

display a black fitted line. (default is FALSE)

showLegend if TRUE and simple=FALSE then a legend will be output (default = TRUE)

trendyOutData segmented regression fitting result from running trendy(); if showFit is TRUE

and trendyOutData is NULL, then the segmented regression will be fit for each

of the genes and it may take longer to run

cexLegend cex option for sizing of legend text, default is 1.

legendLocation whether to place the legend to the right 'side' of each plot or at the 'bottom' of

a multo-panelled plot (default is 'side').

xlab x-axis name ylab y-axis name

segColors define colors for the 'breakpoint', and 'up', 'same', 'down' segments (default:

segColors = c("chartreuse3", "coral1", "black", "cornflowerblue"))

customTitle default is set the plot title as the name of the feature. Otherwise this should be a

named vector, with the featureName as the name and the element as the desired

plot title. (i.e. customTitle <- c("MyTitle" = gene1)).

customLabels.x specify x-axis tick labels instead of using the default values from tVectIn.

spacing.x specify x-axis tick spacing, smaller values give more tick marks.

Value

plot of gene expression and fitted line

Author(s)

Ning Leng and Rhonda Bacher

Examples

```
\label{eq:d1} $d1 \leftarrow \mathsf{matrix}(\mathsf{c}(\mathsf{c}(\mathsf{rnorm}(50,5,1),\mathsf{sort}(\mathsf{rnorm}(50,15,5))),\,\,\mathsf{rnorm}(100,\,50,10)),\,\,2,\,\,100,\,\,\mathsf{TRUE})$ $\mathsf{rownames}(d1) \leftarrow \mathsf{c}("\mathsf{g1}","\mathsf{g2}")$ $\mathsf{colnames}(d1) \leftarrow \mathsf{paste0}("\mathsf{time}",\,\,\mathsf{seq\_len}(100))$ $\mathsf{plotFeature}(d1,\,\,\mathsf{featureNames=c}("\mathsf{g1}","\mathsf{g2}"))$ $\mathsf{d1}(\mathsf{g1})$ $\mathsf{d2}(\mathsf{g1})$ $\mathsf{d2}(\mathsf{g1})$ $\mathsf{d2}(\mathsf{g1})$ $\mathsf{d2}(\mathsf{g1})$ $\mathsf{d2}(\mathsf{g1})$ $\mathsf{d2}(\mathsf{g1})$ $\mathsf{d3}(\mathsf{g2})$ $\mathsf{d3}(\mathsf{g2})$
```

8 topTrendy

Description

Convenient helper function to extract the results of running Trendy. Results data.frames/matrices are stored in the metadata slot and can also be accessed without the help of this convenience function by calling metadata().

Usage

```
results(DATA, type = c("TrendyFits"))
```

Arguments

DATA An object of class SummarizedExperiment that contains normalized expression

and other metadata, and the output of the Trendy function.

type A character variable specifying which output is desired, with possible values

"TrendyFits". By default results() will return type="TrendyFits", which is the

matrix of normalized counts from SCnorm.

Value

A data. frame containing output as detailed in the description of the type input parameter

Examples

```
data(trendyExampleData)
Conditions = rep(c(1), each= 90)
trendyOut <- trendy(Data=trendyExampleData[seq_len(2),])
trendyResults <- results(trendyOut)</pre>
```

topTrendy

obtain top genes from trendy results

Description

reformats the list output for genes with a given adjusted R^2 cutoff

Usage

```
topTrendy(trendyOutData, adjR2Cut = 0.5)
```

Arguments

trendyOutData output from the trendy function

adjR2Cut cutoff for the adjusted R^2. Genes whose adjusted R^2 is greater than adjR2Cut

are called as significant.

trendHeatmap 9

Value

only significant genes will be included in the output. The output is reformatted as: Trend direction of each sample; -1: down, 0: no change, 1: up Slope: fitted slopes, Slope.Trend: sign of fitted slopes, Slope.Pvalue: p value of each segment, Breakpoint: estimated breakpoints, Fitted.Values: fitted values AdjustedR2: adjusted r value of the model Fit: fit object

Examples

trendHeatmap

Draw heatmap of gene expression trends

Description

heatmap of the fitted trends

Usage

```
trendHeatmap(topTrendyData, featureNames = NULL, cexRow = 0.5,
  cexCol = 0.5)
```

Arguments

topTrendyData results from topTrendy() function.

featureNames names of features/genes to plot if the heatmap should be restricted. Deafult is to

plot all genes from topTrendy() function.

cexRow relative text size of row labels, default=.5.

cexCol relative text size of column labels, default=.5.

Value

The function takes significant genes/features called from the topTrendyData() function. These genes are further grouped into three groups: up, down, or no change in the first segment. Within each group, the genes are sorted by their first break point. The heatmap shows expression trends of these three groups of genes. In the heatmap, red/blue/black represents up/down/nochange. A list of genes in the heatmap order is returned.

Author(s)

Ning Leng and Rhonda Bacher

10 trendy

Examples

```
\label{eq:matrix} $$m1 \leftarrow \mathrm{matrix}(c(c(r\mathrm{norm}(50,5,1),\mathrm{sort}(r\mathrm{norm}(50,15,5))),\,\,r\mathrm{norm}(100,\,50,10)),\,\,2,\,\,100,\,\,\mathrm{TRUE})$$ rownames(m1) <- c("g1","g2")$$ colnames(m1) <- paste0("time",\,\,seq_len(100))$$ myTrends <- results(trendy(m1))$$ topGenes <- topTrendy(myTrends)$$  #makeHeat <- trendHeatmap(topGenes)
```

trendy

Trendy

Description

Segmented regression models are fit for each gene. The number of model fits is 1 -> maxK.

Usage

```
trendy(Data = NULL, tVectIn = NULL, saveObject = FALSE,
  fileName = NULL, meanCut = 10, maxK = 3, minNumInSeg = 5,
  pvalCut = 0.1, numTry = 5, keepFit = FALSE, NCores = NULL,
  featureNames = NULL)
```

mented regression model to.

Arguments

Data	a matrix of normalized expression measurements. Rows are genes/features and columns are samples.
tVectIn	a numerical vector indicating the time-points or the order of samples. If it is NULL (default), then the time/order will be assumed to be equaly spaced from 1:N (N is number of samples).
saveObject	if TRUE then the trendy object produced will be saved to use in the Shiny app (default is FALSE).
fileName	the file name (and file path) to save the Trendy object, only used if saveObject=TRUE (default name is trendyOutputForShiny.RData).
meanCut	genes whose mean is less than MeanCut will not be considered, default is 10.
maxK	maximum number of breakpoints to consider. For each gene, trendy will fit $\max K + 1$ models containing $0 \rightarrow \max K$ breakpoints $(1 \rightarrow \max K + 1)$ segments). The model with the lowest BIC value will be selected (unless forceRsq = TRUE, see below).
minNumInSeg	minimum number of samples required to be within a segment. If a breakpoint model has a segment with fewer than minNumInSeg point in any segment, then the model is not considered valid.
pvalCut	p-value cutoff. If the p-value of a segment is greater than PvalCut, then the segment will be called as 'no change'.
numTry	the number of different seeds to try. If all numTry runs fail, then the linear regression (no breakpoints, one segment) model will be returned.
keepFit	whether to report the fitted object (default is FALSE).
NCores	number of cores to use, default is detectCores() - 1.
featureNames	optional parameter to specify an explicit subset of features/genes to fit the seg-

trendyExampleData 11

Value

Trend: direction of each sample; -1: down, 0: no change, 1: up Slope: fitted slopes, Slope.Trend: sign of fitted slopes, Slope.Pvalue: p value of each segment, Breakpoint: estimated breakpoints, Fitted.Values: fitted values AdjustedR2: adjusted R squared value of the model Fit: fit object

Author(s)

Ning Leng and Rhonda Bacher

Examples

```
m1 \leftarrow matrix(c(c(rnorm(50,5,1),sort(rnorm(50,15,5))), rnorm(100,50,10)), 2, 100, TRUE) rownames(m1) <- c("g1","g2") colnames(m1) <- paste0("time", seq_len(100)) myTrends <- trendy(m1)
```

trendyExampleData

Example dataset for Trendy

Description

Example time-course dataset.

Usage

```
data(trendyExampleData)
```

Format

data matrix

Examples

```
data(trendyExampleData)
```

trendyShiny

Trendy shiny app to interactively vizualize results after running trendy().

Description

Trendy shiny app to interactively vizualize results after running trendy().

Value

Opens a browser window with an interactive shiny app and visualize all precomputed Trendy fits.
